

LEOcoin Private Chat (PoS) wallet V3

Installation guide for Mac.

LEOcoin Private Chat (PoS) Wallet V3: Installation Guide for Mac

1. If you already have a previous LEOcoin Wallet on your computer, then please **BACKUP YOUR WALLET** before upgrading to the new version. Click on the “File” Menu Tab and choose “Backup Wallet”. Then choose where you want your Wallet file to be saved (.dat) and give it a name.

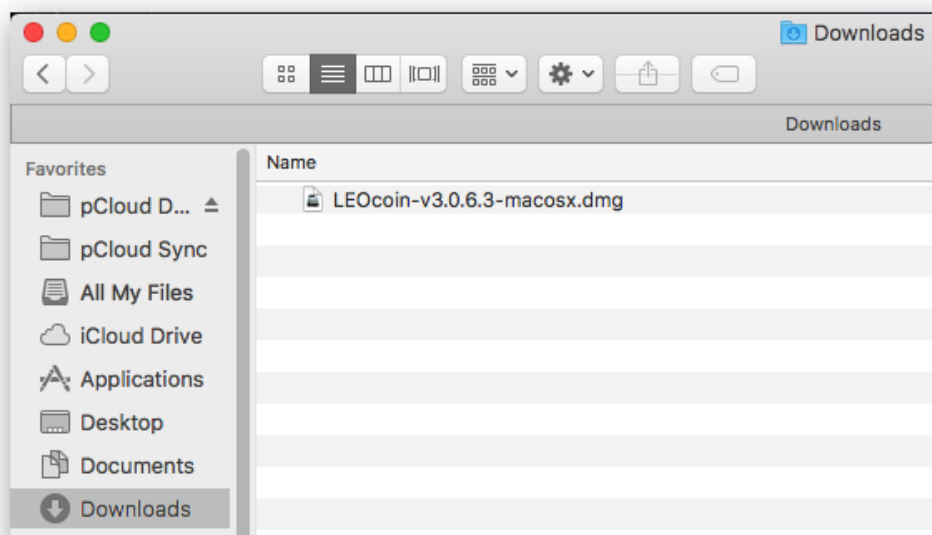

2. Download the MAC client

It is placed in the Downloads folder, and automatically unzipped, and the zip file is moved to the trash.

So all you are likely to see in your dock is this:

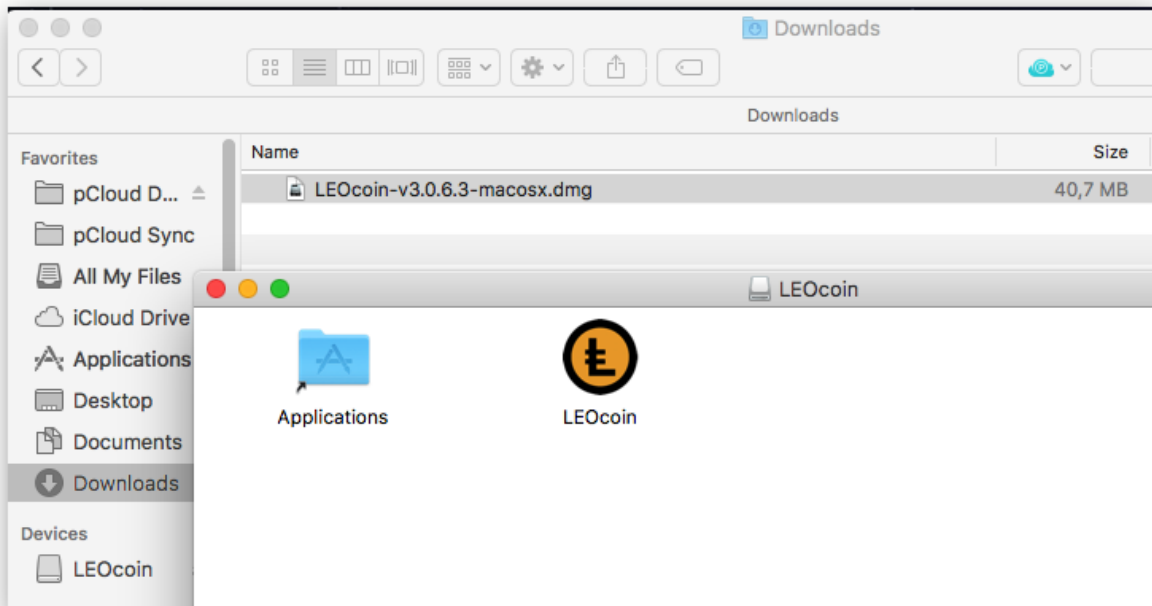

3. Open Finder, click Downloads (if not already selected)

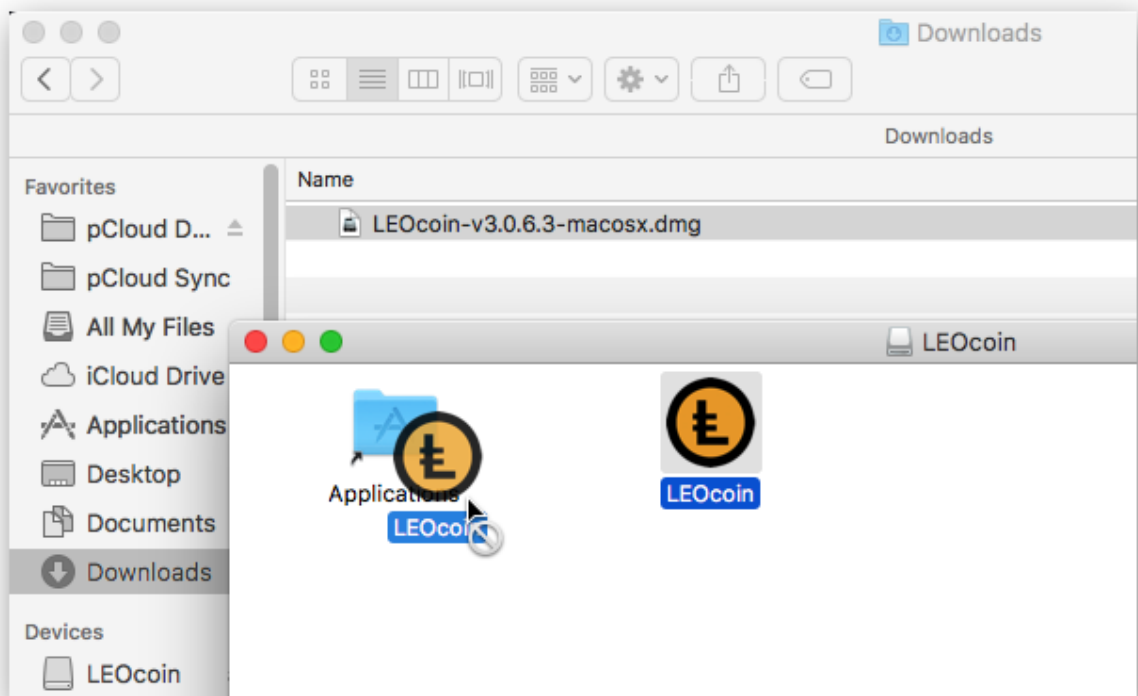

4. Open LEOcoin-v3.x.x.x-macosx.dmg (where x.x.x stands for latest LEOcoin wallet version, as seen in Finder), and this LEOcoin window will appear:

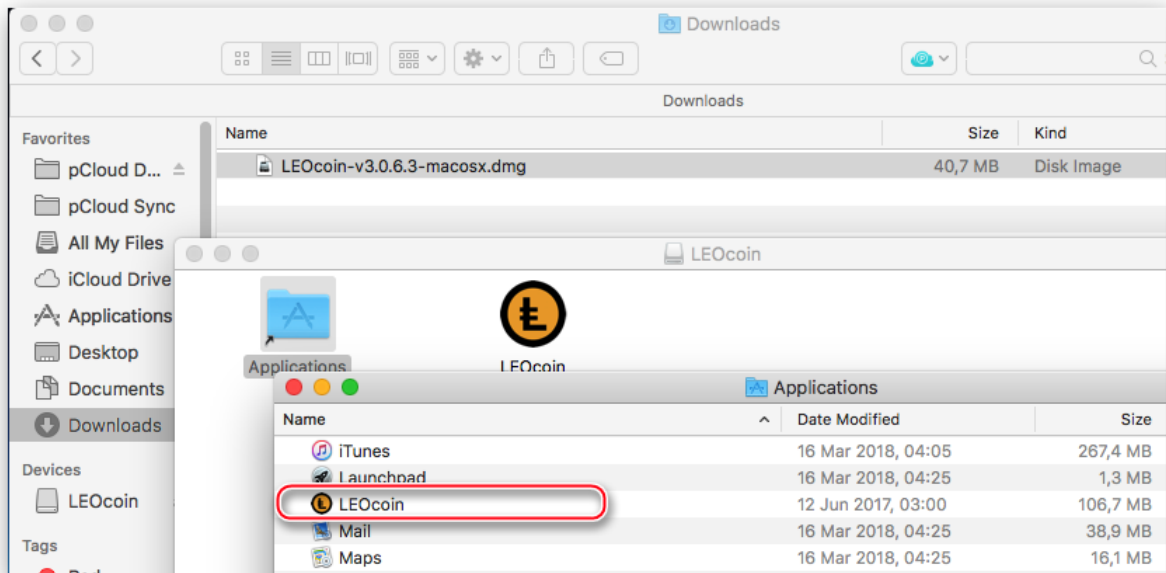

5. Move the LEOcoin icon to your Applications folder

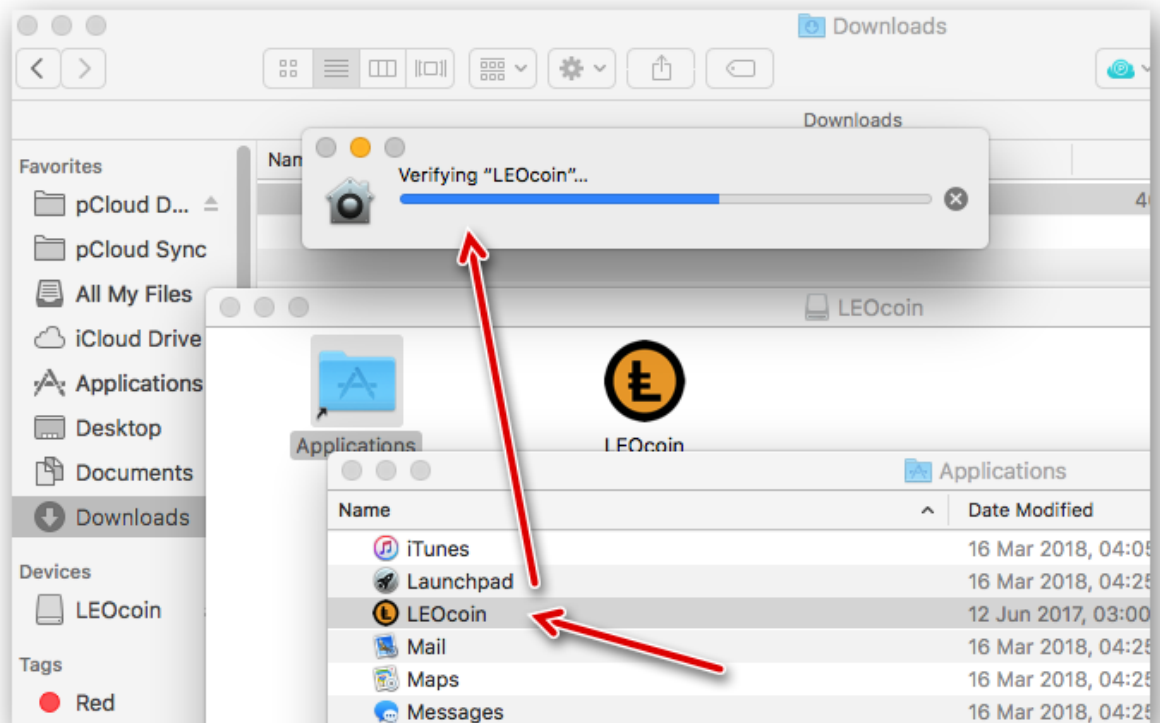

6. Now the LEOcoin wallet application is in place

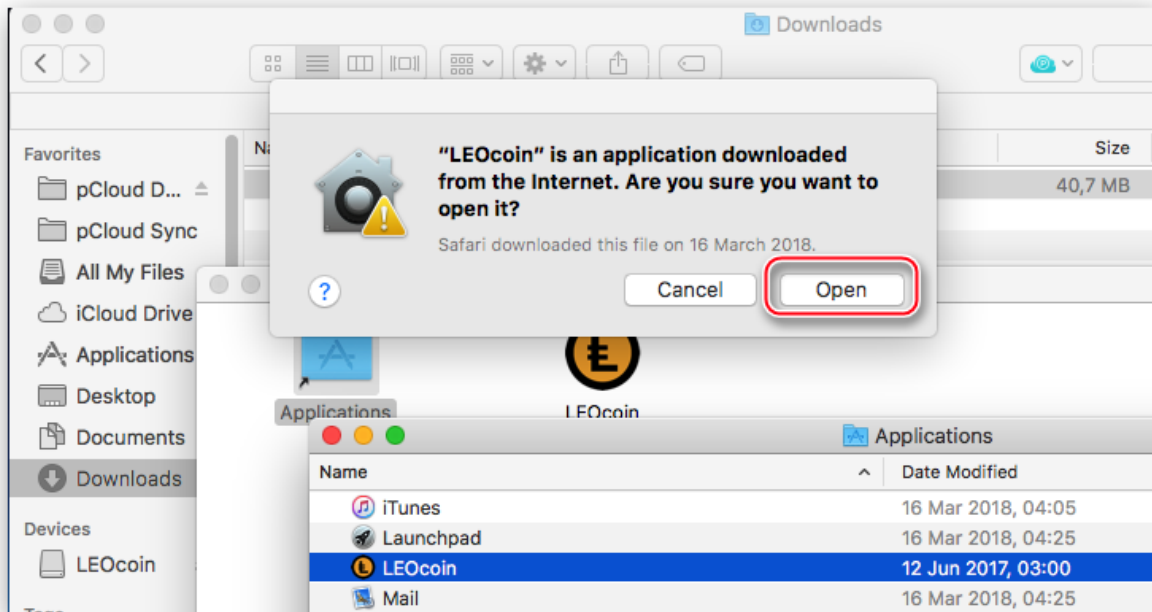

7. You can click on it to start it

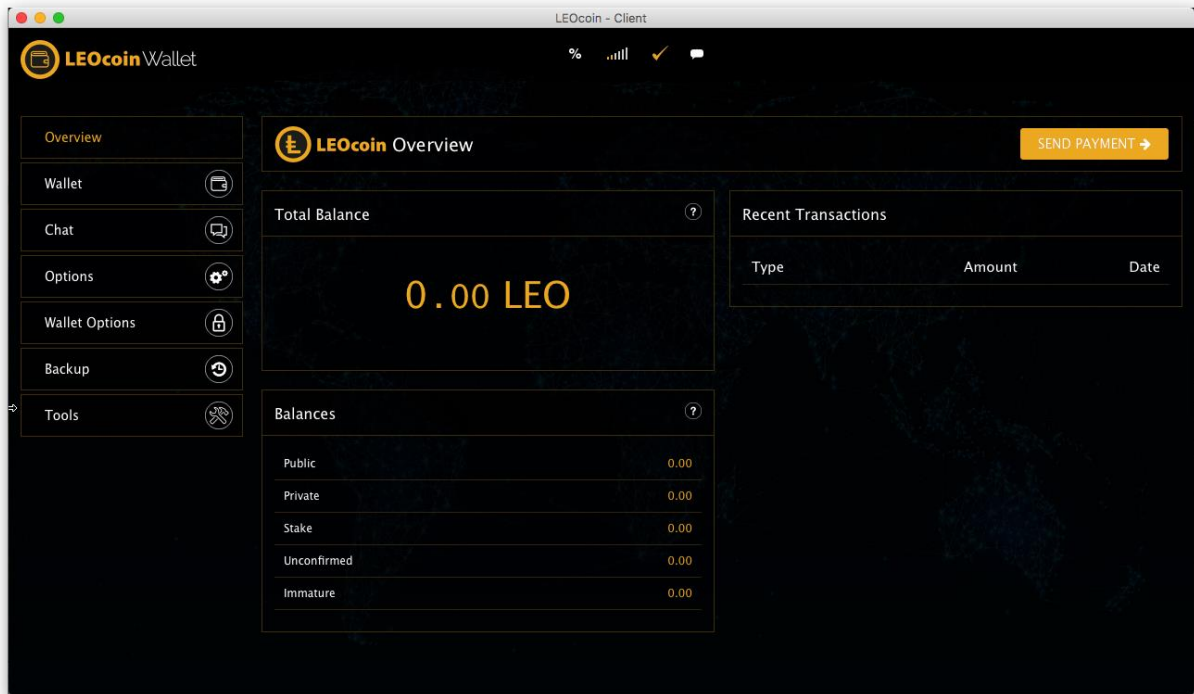

8. After your MAC verifies it, it will ask for confirmation to run it. Click OPEN.

If you are asked by your system to provide your MAC password, please do so. This is just a security precaution, and by providing it, your MAC will allow the LEOcoin wallet's installation.

9. If all done correctly, then the LEOcoin wallet will start.

Now you must allow it adequate time to sync (100%) fully.

Note: The latest version (V3) shown above in this guide, which includes the new advanced features of Private Transactions & Chat, can run in parallel with the previous V2 wallet version (image below). Of course, the previous version (V2) is only needed temporarily, to upgrade the V2 LEOcoins in your wallet to the new V3 LEOcoins, as explained in the main LEOcoin.org page.
